In mathematics, a periodic function is a function that repeats its values in regular intervals or periods. The most important examples are the trigonometric functions, which repeat over intervals of 2π radians. Periodic functions are used throughout science to describe oscillations, waves, and other phenomena that exhibit periodicity. Any function that is not periodic is called aperiodic.

For a periodic function f the circular Hilbert transform is defined as $\tilde{f}(x) = \frac{1}{\pi} \int_0^{2\pi} f(t) \cot(x-t) dt$. The circular Hilbert transform is used in giving a characterization of Hardy space and in the study of the conjugate function in Fourier series.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
