thermal etc. These resources are to be connected to the low voltage power distribution system. The major interconnection requirements for distributed resources can be summarized in the following three categories: general specifications, safety and protection and power quality [1-3]. Figure-1. Distributed resources connected to a power system. 3.

LOW VOLTAGE RIDE THROUGH WITH HIGH CURRENT INJECTION

Low Voltage Ride-Through (LVRT) is one of the most dominant grid connection requirements to be met by Wind Energy Conversion Systems (WECS). In presence of grid voltage dips, a mismatch is produced between the generated active power and the active power delivered to the grid.

Improving Low Voltage Ride-through Capabilities for Grid

operation of the power system and one of the important topics is the capability of the PV system to ride through fault during the disturbance. This paper provides an overview and comparison study about Fault Ride-Through (FRT) capability ... Implementation of Voltage and Frequency Ride-Through

In electrical power engineering, fault ride through (FRT), sometimes under-voltage ride through (UVRT), or low voltage ride through (LVRT), is the capability of electric generators to stay connected in short periods of lower electric network voltage (cf. voltage dip).

Fig. 9: Phase currents in the medium voltage side during a zero-voltage ride-through test of a 2.3 MW full converter WT drive. In Fig. 9, the inrush current of the transformer, due to the heavy saturation, can be seen clearly after voltage recovery. The saturation distorts the low-voltage-side waveform considerably.
