Advances and Emerging Trends in Separations Technologies

Background: The number of new chemical entities and types of in vitro and in vivo samples that require bioanalysis in drug discovery is large and diverse. In addition, method development time is limited as data turnaround is the highest priority. These circumstances require that a well-defined set of bioanalysis options be available in short timeframes to triage samples for analysis.

Development of a high-speed, multiplexed sample-delivery

Quality, safety and effectiveness are the most important attributes of pharmaceutical products. Therefore, the development of analytical methodology to quality control has a fundamental role since it provides an evaluation of the drug regarding its identity, strength, purity and stability during shelf life (Jain and Basniwal, 2013). High-performance liquid chromatography (HPLC) is the technique ...

Development, validation and comparison of two stability

Liquid chromatography-mass spectrometry (LC-MS) is an analytical chemistry technique that combines the physical separation capabilities of liquid chromatography (or HPLC) with the mass analysis capabilities of mass spectrometry (MS). Coupled chromatography - MS systems are popular in chemical analysis because the individual capabilities of each technique are enhanced synergistically.

3.3. System Suitability Criteria. A system suitability test was defined based on the results obtained in several representative chromatograms. The column efficiency determined from the analyte peak >100000, resolution between two analyte peaks >10.0, and RSD for impurity areas in six replicate injection of system suitability solution was <5.0%.
